

## **Desktop Voice Assistant** (Oct 2022 - May 2023)

- To use this assistant Firstly, you have to sign up for a customized experience or use a trial version. Once you have done that, you can use the wake-up word to activate the assistant. The voice assistant will then capture audio input from you in the specified language, which can be English, Kannada, or Hindi.
- After you have provided the input, you need to wait for a response. The voice assistant will then convert your audio input into text using speech recognition software. Natural language processing techniques are then used to parse the user's text and extract the intent and relevant parameters.
- If necessary, the voice assistant will request additional information from you to clarify your intent or better understand the parameters. Based on the user's intent and parameters, the assistant will determine the appropriate action to take. This could involve completing a task, retrieving information, or providing an answer to your question.
- To generate a response, response generation techniques are used, which involve selecting the most appropriate text based on the user's intent and parameters. The response is then converted into speech using text-to-speech software, so the voice assistant can give the final response to you in a natural-sounding voice.
- Once the voice assistant has provided the final response, the process ends. Overall, using a voice assistant involves a combination of advanced technologies such as speech recognition, natural language processing, response generation, and text-to-speech software, all working together to create a seamless experience for the user.
